

Ingeniería Informática	Laboratorio – Práctica 8	SI Módulo 8
Sistemas Informáticos	Curso 2015/16	

Objetivos

- Learn how to manage basic aspects of event monitoring.

Módulo 8 Monitorización de Eventos

1. Read the `logger` manual. Send a message like “hello syslog ...” to the log file in `/var/log/syslog`. Check that you did it correctly.
2. Send all the debug messages of the `sshd` service to the `/var/log/ssh.log` file. Remember to create it previously (empty). Configure the `sshd` service in debug mode and check the effect that this has on the `ssh.log`.
3. Log in as test user and execute the `su` command. Go back to the root user and look for the file where this login information is kept.
4. Configure syslog rotation (`/var/log/syslog` file) so that it is compressed monthly and all the logs generated in a year are storage in a directory named `/var/log/syslog.old/`. Send an email to root each time a rotation is made.
